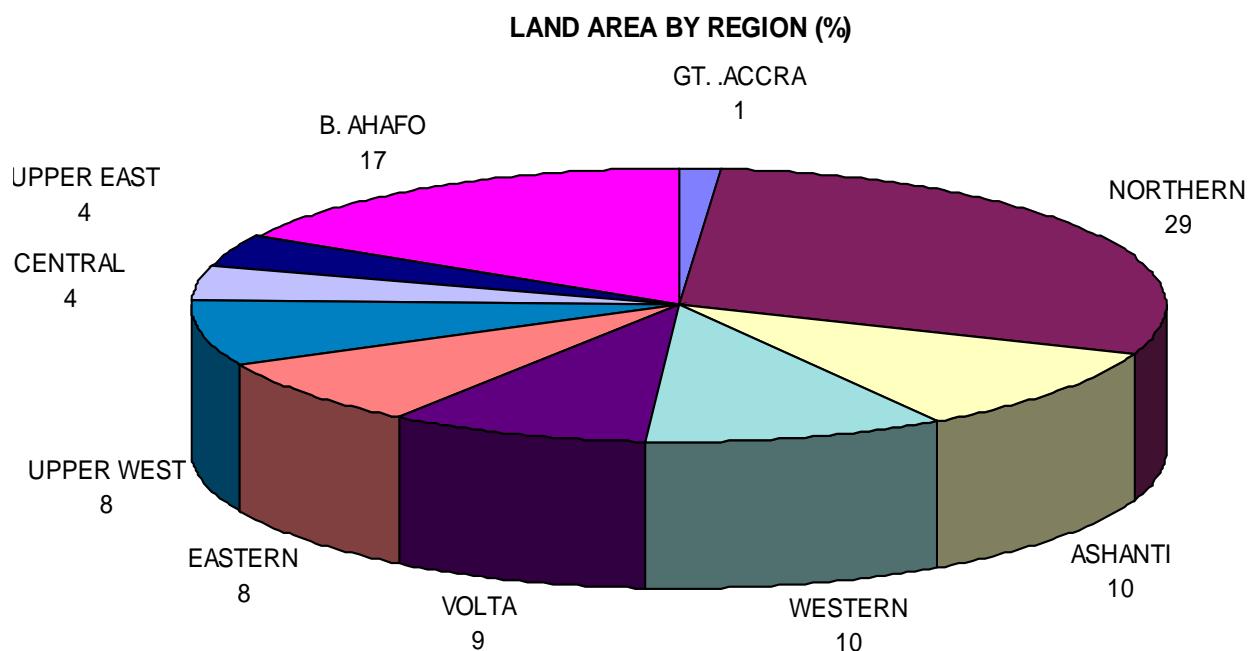

Fig. 1 (Based on Table 2.3)

- 2.4 **Agro-ecological zones:** There are 5 main agro-ecological zones defined on the basis of climate, reflected by the natural vegetation and influenced by the soils. These are Rain Forest, Deciduous Forest, Transitional Zone, Coastal Savanna and Northern Savanna (Guinea and Sudan Savanna).

## 2.5 Rainfall Distribution by Agro-ecological zones

Agro-ecological Zone	Mean annual Rain (mm)	<u>Growing Period (Days)</u>	
		Major season	Minor season
Rain Forest	2,200	150 – 160	100
Deciduous Forest	1,500	150 - 160	90
Transitional	1,300	200 - 220	60
Coastal	800	100 – 110	50
<u>Northern Savanna:</u>			
Guinea Savanna	1,100	180 - 200	*
Sudan Savanna	1,000	150 - 160	*

Source: Meteorological Services Department, Accra.

\*Rainfall distribution is bimodal in the Forest, Transitional and Coastal Zones, giving a major and minor growing season; elsewhere (Guinea Savanna and Sudan Savanna), the unimodal distribution gives a single growing season.

**2.6 Climate:** Tropical eastern coastal belt is warm and comparatively dry, the south west corner is hot and humid, the north is hot and dry. Annual average temperatures range from 26.1°C in places near the coast to 28.9°C in the extreme north. Temperatures can move into the 40s though. The highest temperatures are recorded in the Upper East Region, specifically at Navrongo (see page 6 for Regional Rainfall figures).

**2.7 Topography:** The topography is predominantly undulating, with slopes less than 1%.

Even though the slopes are gentle, about 70% of the country is subject to moderate to severe sheet and gully erosion.

## 2.8 Vegetation

Vegetation Zone	Area ('000sq. km.)	%
<b>Guinea Savanna Woodland</b>	147.9	62.0
<b>Deciduous Forest</b>		
- Celtis-Triplochiton Association	37.3	15.6
- Antiaris Chlorophora Association	27.0	11.3
<b>Rain/Deciduous Forest Eco-zone</b>	8.4	3.5
<b>Rain Forest</b>	7.5	3.2
<b>Thicket and Grassland</b>	4.5	1.9
<b>Sudan Savanna Woodland</b>	1.9	0.8
<b>Swamp and Lagoonal Vegetation</b>	1.3	0.6
<b>Others</b>	2.7	1.1
<b>Total</b>	<b>238.5</b>	<b>100.0</b>

**2.9 Soils :** The soils have predominantly light textured surface horizons in which sandy loams and loams are common. Lower soil horizons have slightly heavier textures varying from coarse sandy loams to clays. Heavier textured soils occur in many valley bottoms and in parts of the Accra Plains. Many soils contain abundant coarse material either gravel and stone, or concretionary materials which affect their physical properties, particularly their water holding capacity.

#### **2.11 Farming Systems**

Agriculture is predominantly on a smallholder basis in Ghana. About 90% of farm holdings are less than 2 hectares in size, although there are some large farms and plantations, particularly for rubber, oil palm and coconut and to a lesser extent, rice, maize and pineapples. Main system of farming is traditional. The hoe and cutlass are the main farming tools. There is little mechanized farming, but bullock farming is practiced in some places, especially in the North. Agricultural production varies with the amount and distribution of rainfall. Soil factors are also important. Most food crop farms are intercropped. Mono cropping is mostly associated with larger-scale commercial farms.

- S1 Highly suitable areas for extensive mechanized cultivation of export and food crops, (cashew nut, sunflower, pineapples, maize corn, guinea corn, soybean, cassava, yam, cocoyam, plantain, beans etc.).
- S1a Highly suitable soils, non-gravelly medium to moderately heavy textured. Suitable for cocoa, coffee, black pepper, sweet berry, ginger, citrus, cocoyam, banana, rice, sugarcane and vegetables.
- S1b Have same characteristics as S1a above, but are situated in Savanna-transition vegetation zone. These areas are suitable for soybean, maize, yams, guinea corn, millet and groundnuts.
- S2 Suitable areas for extensive mechanical cultivation of export and food crops.
- S2a Crop suitability same as S1. Limitation to crop production may be due to gravelly subsoil horizons.
- S2b Crop suitability same as S2a above. Limitation to crop production may be due to either light or heavy textured soils.
- S3 Fairly suitable areas for the cultivation of crops such as maize, cassava, vegetables etc.
- S3a May consist of heavy plastic clays mostly imperfectly to poorly drained soils good for mechanized irrigation of rice, sugarcane, vegetables, maize and millet.
- S3b Mostly alluvial soils suitable for maize, guinea corn and vegetables.
- S3c Includes gravelly and moderately shallow soils. Could be hand cultivated for cassava, vegetables and maize.
- S4 Fairly to marginally suitable areas for the cultivation of crops.
- S4a Consist of gravelly, moderately shallow to shallow, imperfectly drained soils. Limited to hand cultivation of cassava, citrus, palm oil and mangoes. Soils may occur on upland or undulating or very steep slopes. Problem of soil erosion is predominant.
- S4b Soil may be imperfectly drained sands to loamy sands developed over beach sand or may have clay pan beneath the topsoil. Sandy areas may be used for groundnut and tiger nut cultivation.
- S4d Soils are mainly loose sands developed on coastal sand dunes. Suitable for coconut cultivation. May be mixed with organic manure for vegetable cultivation as in Anloga areas.
- N1 Unsuitable areas for upland arable and tree crops.
- N1a Predominantly poor to very poorly drained soils, which may be developed for rice, sugarcane and vegetables.
- N1b Terrace derived alluvial soils, which are dominated by rounded pebbles rendering them unsuitable for mechanized agriculture. May be suitable for maize, cassava, pepper cultivation.
- N1c Terrace derived soils, which contain surface pebbles and an undurated subsoil horizon. Soils may be left to prevailing grass vegetation for rough grazing of livestock.
- N1d Soils dominated by ground water laterites rendering them imperfectly to poorly drained. May be developed for paddy rice cultivation or vegetation should be left for rough grazing by livestock.
- N2 Very unsuitable areas for crop production. Soils are very shallow, gravelly, occurring on steep to very slopes. Should be reserved for forestry, wildlife and watershed protection.
- D Very unsuitable areas for crop production. Soils are very saline and may be utilized for mining of edible salt.

### **Criteria for Estimating Domestic Production**

Livestock	Off Take Rate (%)	Av. Livestock wt. (Kg)	Carcass (% of live animal wt.)	Carcass Wt. of Animal (Kg)
Cattle	11	250	50	125
Sheep	30	25	60	15
Goats	30	22	60	13
Pigs	80	60	70	42

#### **Criteria:**

Meat Production (Mt) = (Off Take Rate (%) x Estimated Population (Table 4.2.3)  
X Carcass Weight of Animal (kg))/1000

Carcass Weight = Average Livestock Weight (kg) x (Carcass Wt %)/100
